GEODESICS

A modular collection for VCV Rack by Pyer & Marc Boulé

User Manual

FATE

non-deterministic event modifier

Is there such a thing as free will? While scientists and philosophers are debating the question, Geodesics proposes FATE, a dual event modifier that will bring any sequencer to life by making its own musical choices.

FATE alters any signal by adding a specific amount of randomness at some chosen points, or by switching in with another signal on a probabilistic way. Without any incoming signal, FATE acts as a dual probabilistic random generator and a Bernoulli gate.

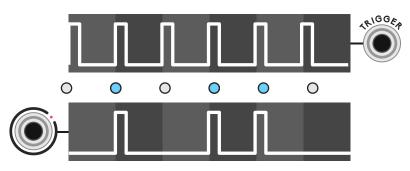

Main Concept

FATE is mainly made to alter a CV sequence but it can be used on LFOs, gate sequences, ...

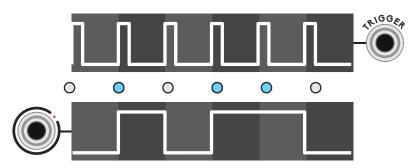

It needs a trigger input to make the choice of altering the incoming signal, preferably synced to the incoming signal.

A gate is emitted when the alteration happens. The **gate output** has two modes (right click):

• Gate: the original trigger signal passes through when random is active

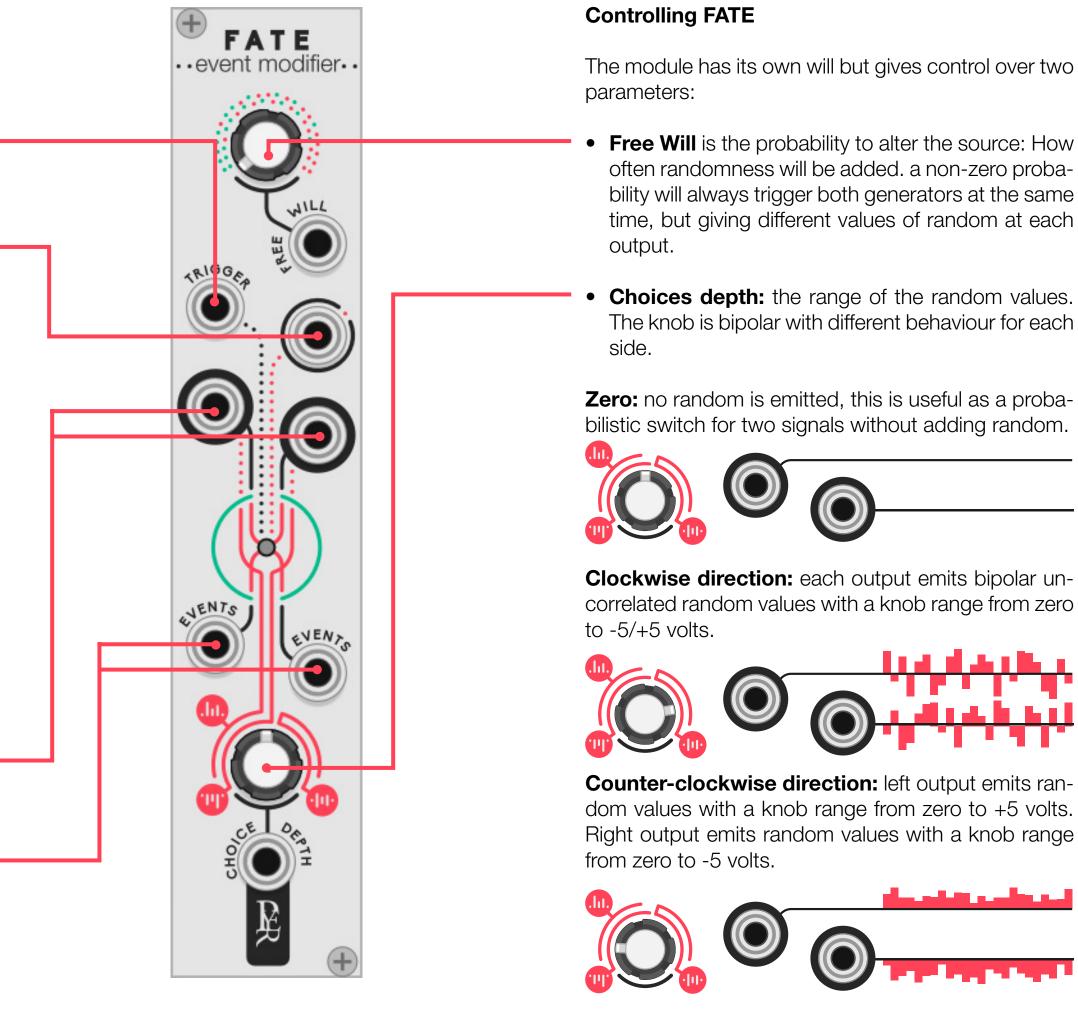

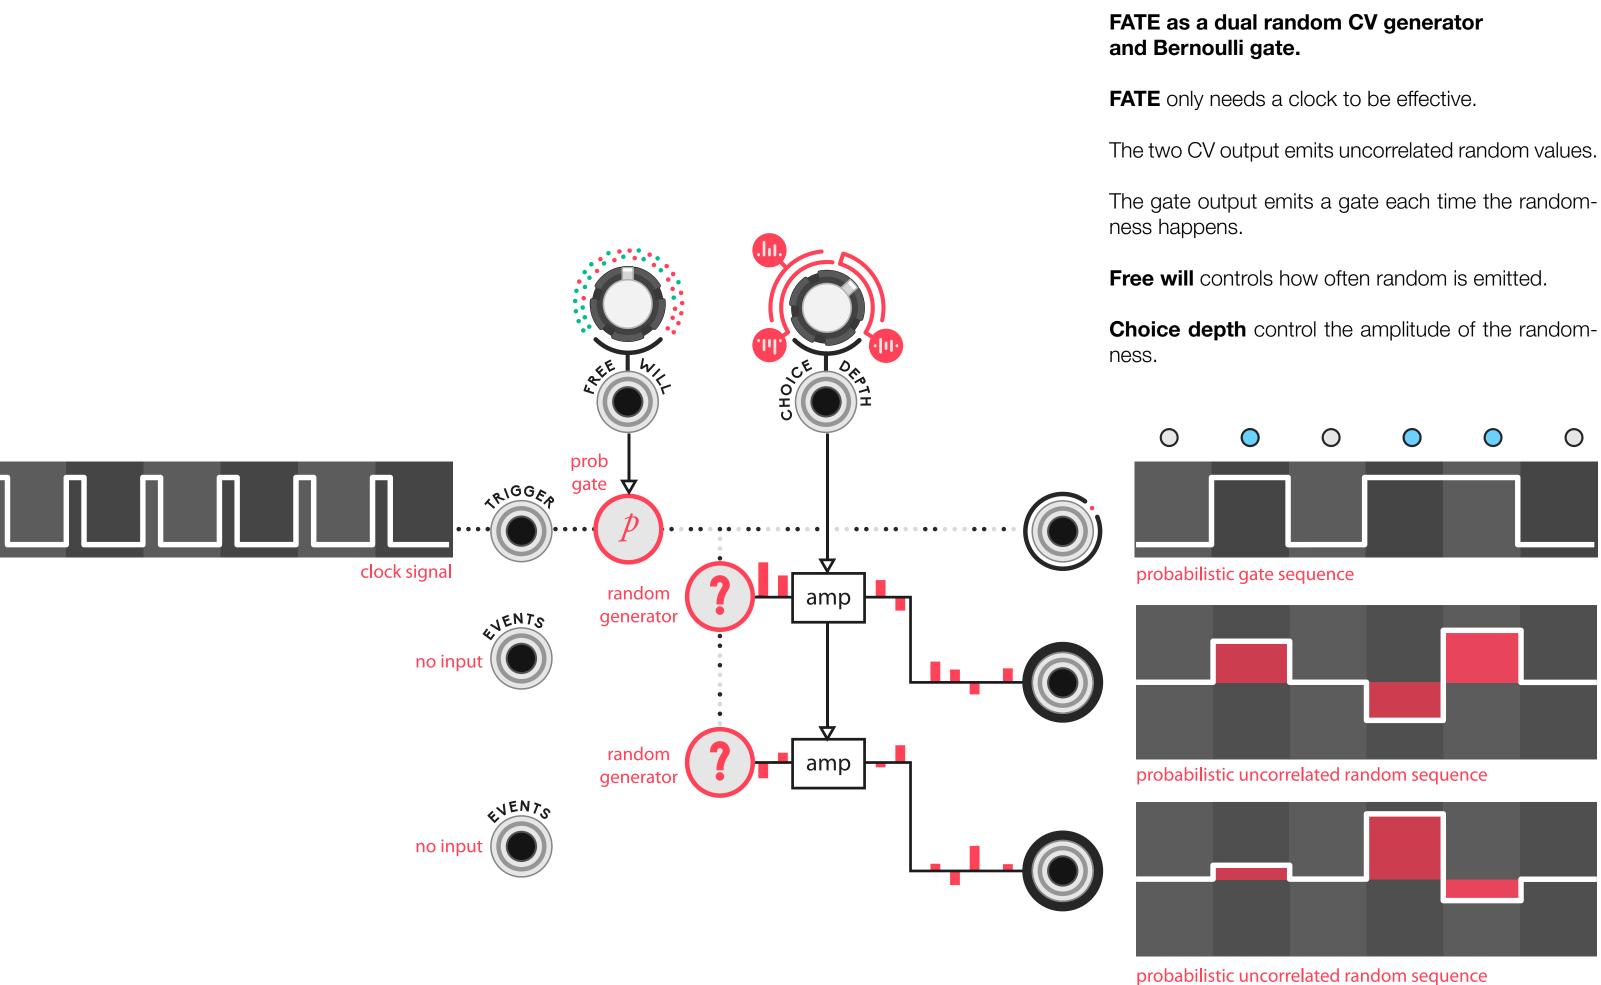

• Hold trigger: the gate is open when random is active.

It has two uncorrelated internal random generators, one for each **CV output**. They can be added to the original signal or used on their own.

When a single signal is used (no matter which one), it is normal to both outputs with different flavours of random. When two signals are used at the same time, FATE will switch the two signals together on a probabilistic way.

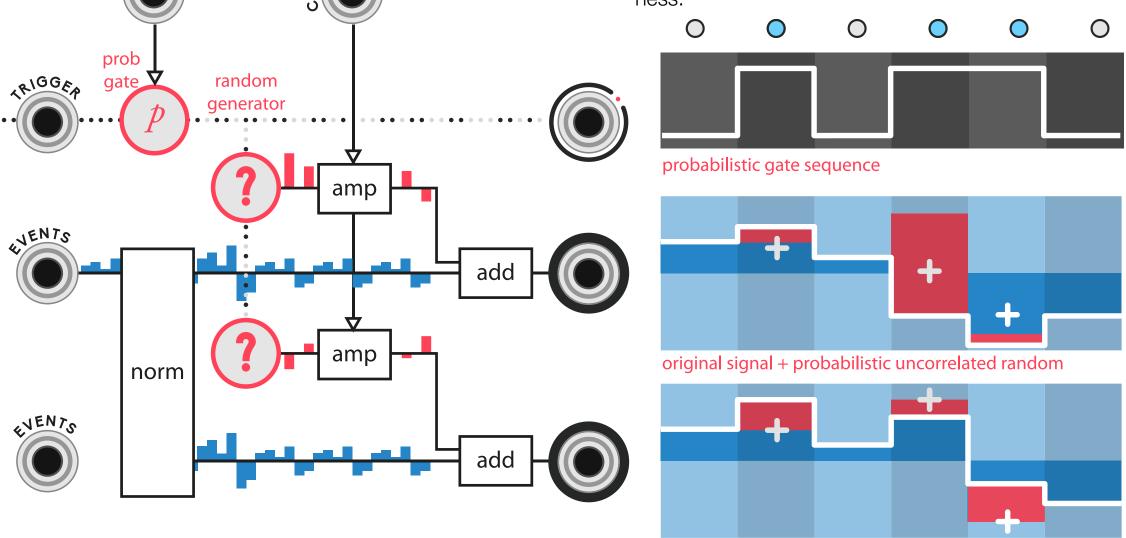

Each output will give its own altered version of the original signal.

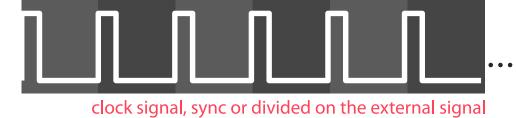

The gate output emits a gate each time the randomness happens.

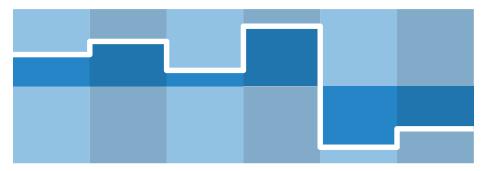

Choice depth controlq the amplitude of the randomness.

O CE

OFPT

external signal, sequence, or Ifo, gate sequence, audio

no input

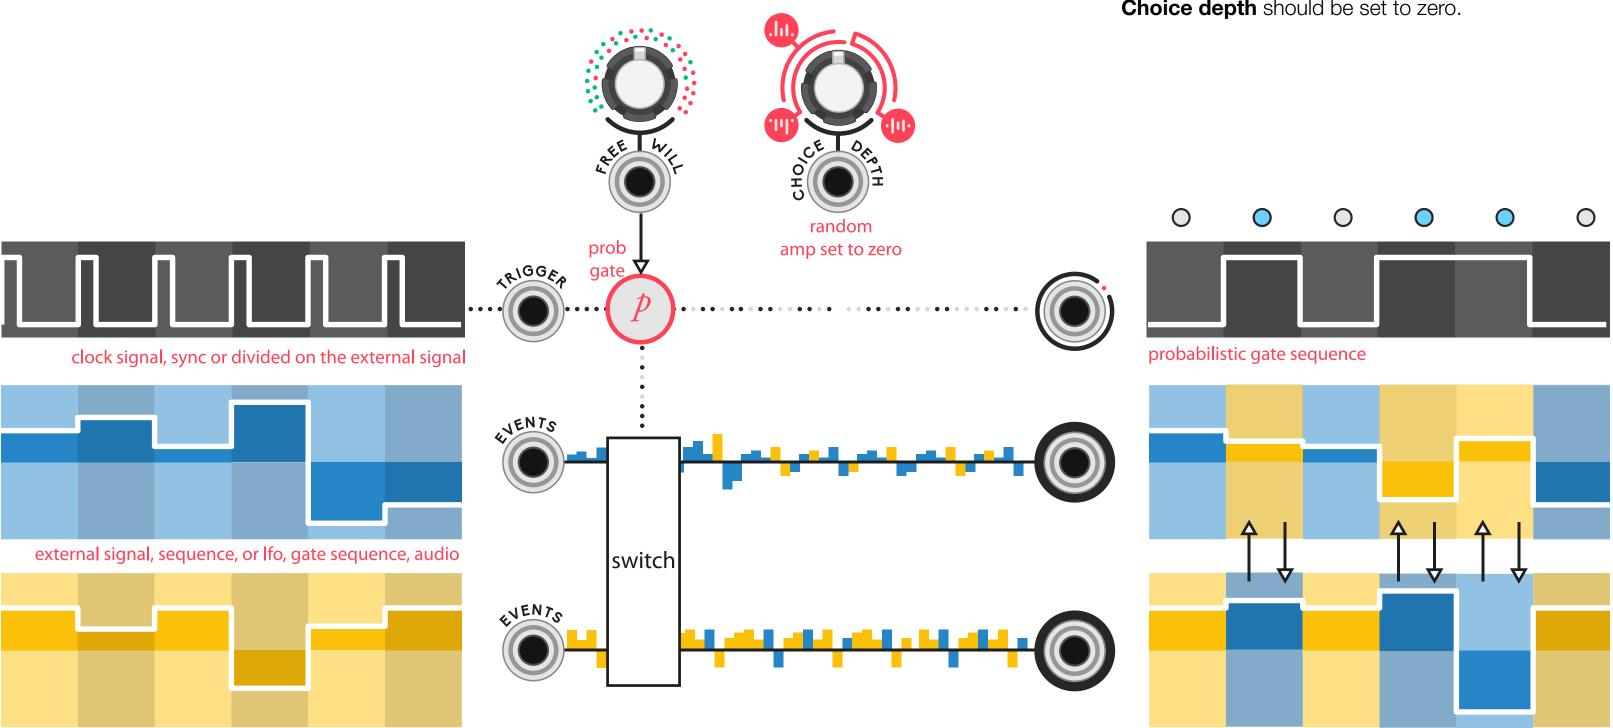

FATE as a one channel event modifier.

It doesn't matter which input is connected; they are normalled to each other.

Free will controls how often randomness is added to the signal.

original signal + probabilistic uncorrelated random

The gate output emits a gate each time the switch happens.

external signal, sequence, or lfo, gate sequence, audio

FATE as a probabilistic two signal switcher.

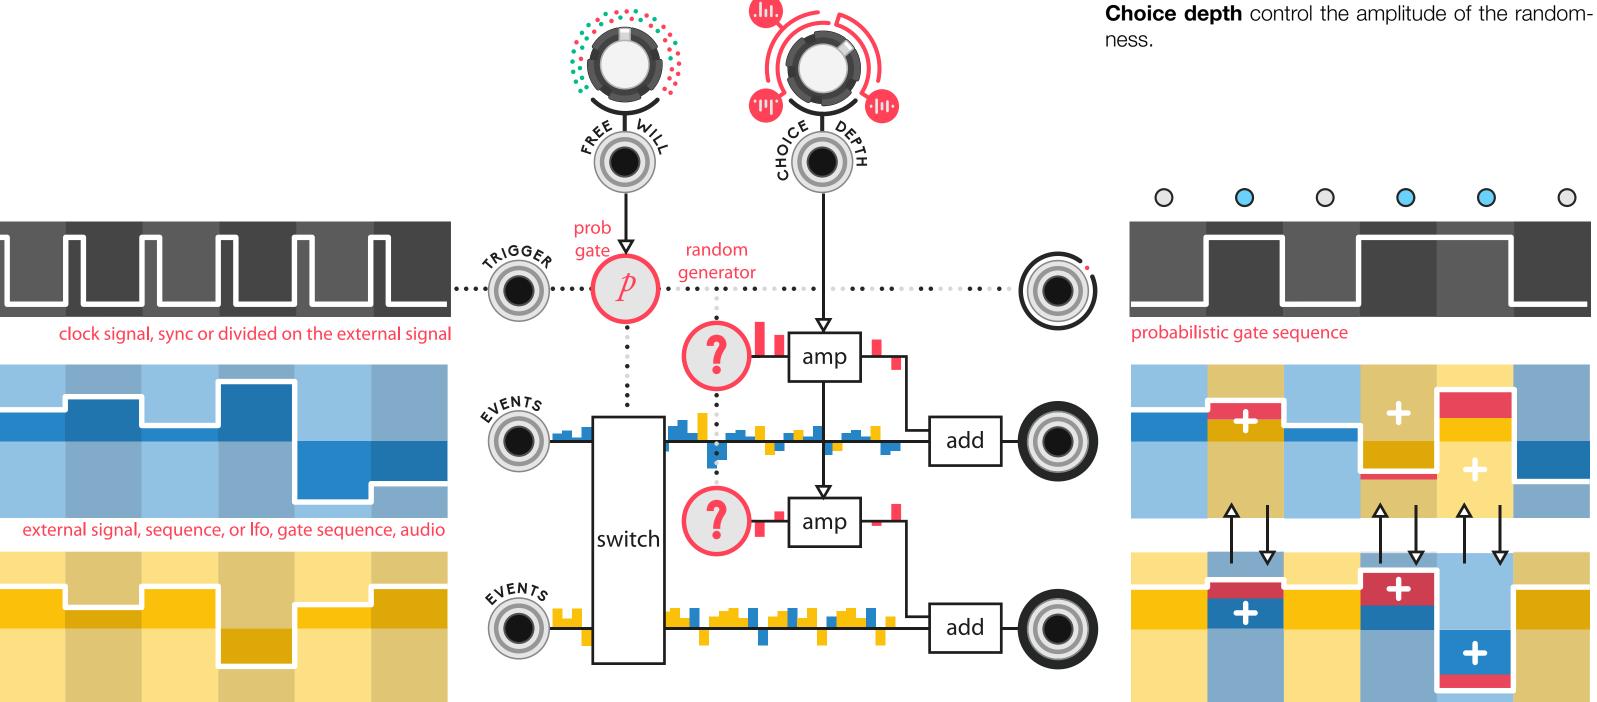

Free will controls how often the signals are switched and altered.

Choice depth should be set to zero.

original signal with probabilistic switch between the steps

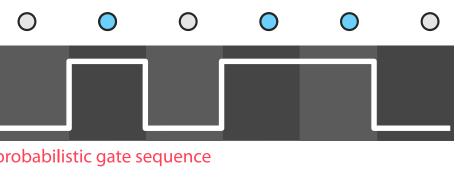

The gate output emits a gate each time the switch happens.

Free will controls how often the signals are switched and altered.

external signal, sequence, or lfo, gate sequence, audio

FATE as a probabilistic two signal switcher and modifier.

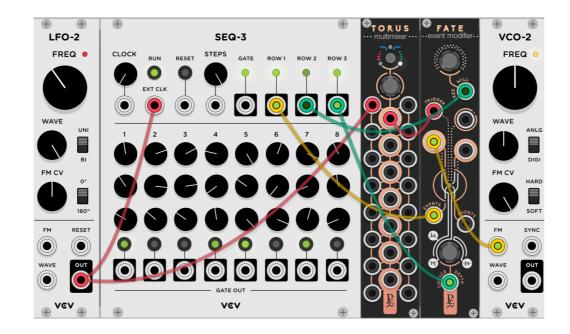

original signal with probabilistic switch + uncorrelated random

FATE with a multi-channel sequencer.

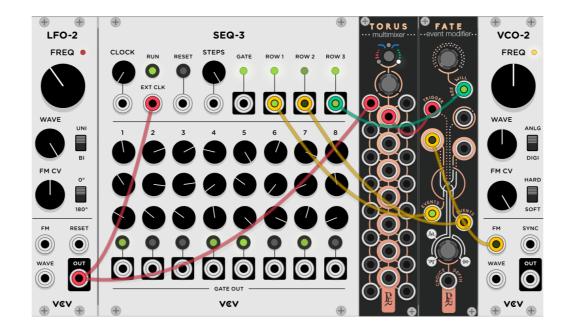

When FATE is used to alter a CV sequencer, **Free will** and **Choice depth** can be controlled by other CV sequences to make the random happen on specific notes of the sequence. FATE can then turn any multi-channel sequencer in our Entropia sequencer.

For a correct timing, FATE and the sequencer has to be triggered by the same clock source to avoid any latency

- Add randomness to a sequence (input 1, output 1).
- Use a second sequence to control which step should be randomised (Free will CV in).
- Use a third sequence to control which step should have a wider random (Choice depth CV in).

- Switch between two sequences (inputs 1 and 2, output 1)
- Use a third sequence to control which step should be switched (free will cv in)

Polyphonic FATE

Fate is also polyphonic. The number of output voices will be defined by the number of event channel or trigger channel, whichever is the highest. Modulation input are also polyphonic. It is recommended to experiment with different trigger sources on the input to add richness to the generated melodies.

GEODESICS

A modular collection for VCV Rack by Pyer & Marc Boulé

Geodesics has been created in July 2018 by Pierre **Collard** (industrial and graphic designer based in Brussels) and Marc Boulé (developer and creator of Impromptu Modular based in Montréal).

Just like many projects within VCV Rack, Geodesics is also a community effort and it would not have been possible without the help of many users, composers and developers participating one way or another to enhance the quality of the project.

Among them we would like to address a special thank to those who helped us in the beta testing phases, who made tutorials, who proposed their help in any way and those who brought the collection to life with some great pieces of music: Omri Cohen, Georg Carlson, Xavier Belmont, Steve Baker, Marc Demers, Adi Quinn, Ben De Groot, Latif Karoumi, Espen Storo, Synthikat, Dave Phillis, Carbonic Acid, Martin Luders, Ghalebor, Stephen Askew, Lars Bjerregaard, Richard Squires, Lorenzo Fornaciari, Adi Quinn, NO rchestra, Poxbox23 and Ananda Bhishma.
